Frontend Technologies

Assignment - 1

Q1) What is Figma?

Ans) Figma is a UI/UX design application which is used to create interfaces for apps, websites & digital products. Figma provides a digital whiteboard where designers can draw scenes, test ideas and collaborate. Figma can be accessed either on websites as a webapp or can be installed locally on a desktop. Modern teams prefer it because it reduces friction between designers & developers and speeds up workflow.

Q2) Designing v/s Prototyping in Figma?

Ans) In Figma designing consists creating the look and layout of a website. Designing is about deciding colours, spacing icons and placements of elements like buttons & forms. It is visual & static where goal is to define how a product or page should appear.

While in Figma Prototyping is creating a simulation and interactive content that was designed. It shows how designed app would work clickable

buttons, transitions and flows all included. It shows how the app works not how it looks. It helps user journeys before programming.

Real Life example :-

Consider a food delivery app:

Designing :- How home screen looks, how products appears & look, etc..

Prototyping :- How payment connects with cart which connects with menu & home.

Q3) Components & Styles in Figma.

Ans) Components are reusable blocks of UI like button cards, newbar or input fields. Components are reusable means we don't have to redesign the button or cards, etc. again & again, instead an master component can be created, when a master component is ~~created~~ updated Other copies are updated automatically. It saves time and prevent inconsistencies.

Styles store visual rules such as colours, Fonts, shadows & spacing e.g., Primary blue & needing 'h1' styles are changing according to brands.

Q4) Auto layout in figma?

Ans) Auto layout auto arranges layout based on certain aspects like spacing, padding & alignments. Instead of manually moving objects, items reposition them. It behaves similar CSS flex.

It helps in creation of responsive design as you have properties like fill container or hug content. So layouts adapt to the screen width or size. Designers multiple screensizes easily.

Q5) Developer handoff process in figma.

Ans) After design is complete, figma supports a smooth handoff to developer. Designers share the file using simple link with view or inspect access. In inspect/div mod deves cans click any element to see it size exact value etc..

Figma automatically generates CSS, IOS (Swift), XML, etc..

Assets and icons can be exports as PNG, SVER or JPG format.

So the Process is:-

Design Figma → Prototype → Share Link → Inspect → Expert Assets

Implement Code
